The material of choice for an impression intended to construct a porcelain fused to metal fixed prosthesis is:

- Irreversible hydrocolloid impression material
- Reversible hydrocolloid impression material
- Poly sulphide rubber impression material
- Polyvinyl siloxane (silicone) rubber impression material

The risk of perforation is high in the upper first premolar when doing an access cavity is due to:

- Distal concavity of the root.
- Mesial concavity of the root.
- Buccal concavity of the root.
- Lingual concavity of the root.

The X-ray photons generated by the dental X-ray machine have

- the same energy and wavelengths.
- many different wavelengths.
- only a few energies capable of penetrating dense tissue.
- many different speeds.
- this depends on the type of the machine.
